PUFFINS

The horned puffin gets its name from the small, horn-like “eye-lash” that extends above the eye. The tufted puffin is the largest puffin and is primarily black in color with only a white mask on its face. The bright colors on the puffin’s beak and legs appear only during mating season.

All puffins dive, fish, and sleep out at sea for months at a time.

They have waterproof feathers and the ability to drink salt water and catch food. Puffins “fly” both in the air and the sea. They can dive down to 200 feet and stay under water for up to a minute, scooping up small fish one-by-one. The puffins hold the fish crosswise in their beaks with their tongue while diving for more. The average catch is around 10 fish per trip, but they can easily carry up to 40 fish at one time. The biggest haul on record is 62 fish at once!
